PLANT COLLECTING EFFORTS OF
O. B. METCALFE
IN THE BLACK RANGE DURING
1904 AND 1905.**

PLANTS+ OF THE BLACK RANGE OF NEW MEXICO

AN ANNOTATED CHECKLIST
EDITION ONE OF VOLUME ONE

This checklist of the plants (including a few lichen and other non-plant species) of the Black Range of southwestern New Mexico draws from a variety of sources. It is a work in progress and undoubtedly contains errors. If you encounter errors of substantive omission or commission or administrative errors (broken or incorrect links, spelling, etc.) please let me know at rabarnes@blackrange.org so that the errors can be corrected. Your help in this manner will be of benefit to the general community.

Methodology

This checklist was put together in the following manner:

- ✦ A search of the [SEINet](#) data base (Arizona & New Mexico Chapters) was conducted to determine the possible species in the Black Range;
- ✦ A preliminary search of the [Consortium of North American Lichen Herbaria](#) data base was conducted to determine possible species in the Black Range (this work is incomplete);
- ✦ These listings were matched against the files of the [Vascular Plants of the Gila Wilderness](#) and the [photo galleries of the Black Range website](#);
- ✦ If there was a match, a link to the species page on the Vascular Plants of Gila Wilderness site and/or the appropriate page on www.blackrange.org was entered in the notes column;
- ✦ A review of the Vascular Plants of the Gila Wilderness data base was conducted to determine if an image from the Black Range is included on the species page at that site. If so, the Vascular Plants of the Gila Wilderness was used to verify that the species can be found in the Black Range. In the notes column this is indicated by an entry for the location where the species was found followed by a '(V)';
- ✦ If the species is included in the photo galleries of the Black Range website, the location where the species was found was entered in the notes column followed by "(B)";
- ✦ For all species not verified for the Black Range in the review of Vascular Plants of the Gila Wilderness or the

Black Range website, a search for specimen sheets was conducted;

- ✦ If a specimen sheet from the Black Range was located for the species, an entry noting this was made in the notes column. The name of the collector and the general location where the specimen was collected was entered in the notes column as a link to the specimen sheet. Such entries are shown in dark blue.
- ✦ Species which are not verified for the Black Range are indicated by a light blue "cell filling" in the first cell in the species row.

Disclaimers and Points of Clarification

In some cases, you may note that an entry from the Vascular Plants of the Gila Wilderness data base has been entered on the checklist but the initial cell of the species listing is filled in light blue indicating that the species was not verified for the Black Range following the process described above.

It is quite possible that most (perhaps close to all?) species listed in the Vascular Plants of the Gila Wilderness data base are found in the Black Range. But absent a clear documentation of that fact, we have highlighted them for more scrutiny - the light blue cell. On the flip side of the coin, there are some listings in this checklist which are not listed on the Vascular Plants of Gila Wilderness site.

We have attempted to adhere to a conservative definition of "the Black Range". Basically, it is the area confined by the major road systems which border the range; NM-59 in the north (taking in some of the area north of this highway); North Star Road on the NW side of the range; NM-35 from the junction of North Star to NM-152; NM-61 from NM-152 to US-180; US-180 to NM-26; NM-26 to NM-27; NM-27 to Hillsboro; and then roughly northward to Winston/NM-59. These general boundaries are shades of gray - City of Rocks State Park is included, the area to the east of US-180 is not included until the foothills are encountered; and the eastern foothills are included for roughly 5 miles west of Hillsboro and north.

Black Range website photo galleries: The images in the galleries have not been thoroughly vetted but are believed to be accurately identified.

In some cases the SEINet listing could not be verified for the Black Range, as noted above. There may be several reasons why this is the case, including; inconsistencies found on the specimen sheets which clouded the area of collection, and a certain lack of "search capability" on the part of the editor. Most importantly, however, the entries listed in light blue should serve as a guide for the efforts of future collectors.

Vascular Plants of the Gila Wilderness is the premier botanical website for southwestern New Mexico. We all owe a debt to Russ Kleinman and the many other contributors to that site for the work they have done (and regularly do).

The "verification listing" has no other significance than the fact that the indicated source was used for initial verification. It does not indicate, for example, that the specified location is the best location to see the species.

Scientific names may be subject to challenge. The species name used here generally follows the nomenclature used in **Vascular Plants of the Gila Wilderness**. In some cases speciation determinations may be in dispute. In some cases the "generally accepted name" may be in dispute.

Unless there is no accepted English common name for a species, at least one of the most common names is listed.

Other Volumes

This checklist is the first volume in a planned three-volume set. All three volumes present the same information (except there will be minor variations due to digital updates) but it is arrayed differently.

- ✦ **Plant species are listed in alphabetical order by family name, and then by scientific species name, in this volume. This volume includes a listing of the plant collectors who collected the specimens referenced in the checklist.**

- ✦ **In the second volume, species will be listed in alphabetical order by scientific species name. The second volume will list the sites most frequently referenced in the checklist and provide a general description of their locations.**
- ✦ **In the third volume, species will be listed in alphabetical order by English common name.**

We currently anticipate that Volumes Two and Three will be issued prior to the end of 2020.

Second Edition

We plan one more edition of this checklist, to be issued during the second quarter (calendar year) of 2021.

Your help in improving this, the first edition, will be reflected in the second edition. No further editions are planned at this time.

Copyright

This checklist is not available in hard copy; you can not buy it. It is free. If you have a copy, please forward it to anyone who might like to have it. The Black Range website does not accept advertisements nor does it accept monetary donations. It is "not-for-revenue". It is about sharing knowledge. This publication is available as a .pdf on the Black Range Website or in magazine format at our [bookcase](#).

This publication is offered to you under a Creative Commons non-commercial license; you are free to use it for whatever non-commercial purpose you wish. Copyright will be aggressively enforced and penalties exercised in the case of any unauthorized commercial use.

Plant Collectors In The Black Range

The Black Range is a marginal place. It is on the margin of several ecosystems and thus many species live or pass through this region. In the case of flora, not only is the Black Range at the edge of several geographically defined flora zones, it is a sky island, rising from the desert foothills and into the sky on all of its edges - except in the northwest, where it abuts the Gila.

The geography and topography of the Black Range create many environmental niches, and because of that the species count in this area is significant. In this checklist, there are 1,280 species which have been verified and an additional 460 species which may be found at a later date (or evidence that they have been found previously may be located).

The listing of plant collectors which follows is not a definitive listing of all who have collected in the Black Range. It is a listing of those collectors who have collected specimens which were used to verify the species for the Black Range in this checklist.

By the same token, the listing of dates is not a definitive listing of when the plant collectors were collecting in the Black Range. It is the range of dates which bracket the collection dates for the specimens used to verify the species in the Black Range.

That said, a few points from the listing are obvious:

- Scientific plant collecting started early in the Black Range (compared with settlement dates);

- There has been a steady stream of plant collectors in the Black Range;
- The expertise of the collectors was (is) significant;
- Many specimens have been collected near human settlements and along transportation corridors;
- Those interested in studying the flora of the Black Range benefit greatly from the proximity of Western New Mexico State University in Silver City and New Mexico State University in Las Cruces; and
- Collectors, students, and botanists have been attracted to this area for well over a century - with good cause.

This checklist is, hopefully, a tool which can aid those interested in the natural history of the Black Range, especially those with a flora slant to their passion.

We are sincere in our request for corrections and additions. The aim of this project is to better our knowledge of this region and to build a set of tools which help achieve that goal.

O. B. Metcalfe

The Black Range may be known for a great many things, but "firsts" is not one of them. That said, let us consider the Skyrocket, originally described as, *Callisteris formosissima*, a plant species that is very familiar to anyone who has spent time in the Range. And while we are at it, let us consider Orrick Baylor Metcalfe, generally known as O. B. Metcalfe.

Metcalfe collected **many botanical specimens in the Black Range between 1902 and 1905**. One of those specimens which he collected is shown here: the type specimen for *Callisteris formosissima*. The "official" species description for the Skyrocket is based on this specimen, from about 9,000 feet in the Black Range, in 1904.

One test of a botanist's importance in the field is whether or not there are species names which recognize him/her in some manner. There are several species which now honor, or have honored Metcalfe: *Senecio thurberi* was originally described as *Senecio metcalfei* - from a specimen Metcalfe collected at Hillsboro Peak; *Oxytropis lambertii* var. *bigelovii* was originally described as *Aragallus metcalfei* - from a specimen Metcalfe collected on Sawyer's Peak; and *Meibomia metcalfei* was originally described from a specimen Metcalfe collected in Animas Creek. If I take off my Black Range centric hat for a moment I should note that he is recognized in the names of several other species, generally in cases where he collected the type specimen.

In the summer of 1904 and spring of 1905, Metcalfe collected several specimens in the southern end of the Black Range, including; *Acacia constricta paucispina*, *Antennaria anacleta*, *Bidens cognata*...(the list is rather long and includes *Meibomia metcalfei*).

During 1904 and 1905, Metcalfe made Kingston his headquarters for his collection expedition. It was on July 6, 1904 that he collected the type specimen for the Southwestern Prickly Poppy, *Argemone p. pleiakantha*.

What else do we know about Metcalfe, other than that he was born (1879), collected for a few years in the Black Range, and died in 1936?

Metcalfe received his Bachelor of Science and Masters Degrees from New Mexico Agricultural College (now NMSU). He studied under Elmer Otis Wooton. His bachelor's thesis was "The Flora of the Mesilla Valley" and his master's thesis was on soil analysis and tension line in Mesilla Valley between saltbush and creosote bush.

In botanical circles he is known as a plant collector and ecologist.

Following his education he lived in Mangas Springs and Silver City. After the collecting period described here he taught auto mechanics and had an auto business in Silver City. He also worked in mines and was killed in a mining accident in 1936.

The above is a reprint from the first issue of the Black Range Naturalist. It is part of an article originally titled "Skyrocket - *Ipomopsis aggregata* subsp. *formosissima*".
